LONG ISLAND Sinclair TIMEX GROUP

L.I.S.T.ING

February 1985

Issue Price $1.50

MEETING NOTES JANUARY 6, 1985

The January meeting was called to order at 2:30PM at 9 Dartmoor Drive in Northport. Minutes of the last meeting were printed in December-January newsletter.

The Sec'y Treasurer reported that current paid up membership stood at 53. The projected year end (January 31) balance for the treasury is $200.00. This includes a number of paid up subscriptions through 1986, but will still leave a small balance which will be carried forward. No suggestions for use of the funds were tendered from the floor, during this portion of the meeting.

We have received inquiries about our mailing list and the question of how to handle these was thrown out to the members. It was decided, by voice vote, that we would use a "positive option" plan. That is, members who wish to receive catalogs, etc. and be on our "official" mailing list must so indicate to the membership chairman (currently the Sec'y. Treas.). If you do not specifically request to be on the list sent to outside concerns, you simply won't be on it. (In "computerese," the "default" value is not to be on the list). Bob G. suggested that the meeting host be reimbursed for incidental expenses for the meeting. It was unanimously agreed that the host be provided with $.50 per attendee to help cover his costs for coffee, donuts, etc.

With 53 (56 as of 1/14) members, the maintenance of the mailing list, let alone the data base, is becoming increasingly difficult. Stewart N. volunteered his services to have the data entered into D-Base III (on his P.C.).

It was recommended that we contact Computer Living, N.Y. (Ellis Booker (212)-505-2600) to tell them of our support for ZX/TS computers. This will be done.

Costs have been increasing (now 24 pages - 12 sheets). It costs at least 4¢/sheet to print and $.37 to mail the newsletters. We will need to print about 100 copies of this issue.

Dues were raised to $15.00/year ($12.00 to charter members who "re-up" prior to the March meeting).

Next meeting will be at H. Werthouers place in Seaford on February 3rd, Sunday at 2PM. Bring your latest toy. If you have hardware to demo, please bring a power strip. A folding chair, or two, might help, as well.

A Special BASIC - BASIC instructional period will be conducted by Steve Kaye from 1PM to 2PM at Herberts place. If you're a beginner or even an intermediate programmer with a problem, you should attend this class. Steve will concentrate on TS 1000, but, of course, that covers almost 90% of 2068 commands. Steve will probably be the focal point for our TS 1000/ZX81 special interest group, so if you're interested in (helping to start up) this SIG please contact him.

The meeting broke up and various hardware/software packages were demoed:

Paul D. showed his Sear's RGB monitor (see Article) - Bob G. had his RGB monitor and modified Spectrum, Bob has been able to get color from his Spectrum by changing the crystal. He rewired the Spectrum Power supply for 110 volts, and now has a true Spectrum, which can run here in the states. - Nazir P. demoed his microdrive. Several members had brought in their 2068's at our request and were tested with EMU-1 and Nazir's expansion board (with the 90pf capactor on A3-NO, we still don't know why that helps!) of ten machines, all but one (mine!) were made to function with the m-drive and "twister". Buss loading seems to be the problem as we found that about 1/2 of all 2068's don't even need the capacitor. The 2068 is apparently just a little too tightly designed. More on this later. Remember, too that, as of right now, m-drives won't work with the ROM without internal changes. Your best bet for now (or until a buffered bus board comes along) is to wait and see. As an example: this past week, my EMU-1 gave up its life for the cause. See Nazer's article for the latest story.

Taswod II was demoed in 64 column mode on Bob's monitor. It looked good on Chuck Russell's $40 special, B & W monitor too!

SPECIAL NOTES

THE FEBRUARY MEETING WILL SEE THE NOMINATION OF OFFICERS FOR 1985. PLEASE BE PREPARED TO VOTE/VOLUNTEER.

REMEMBER, THIS IS YOUR LAST ISSUE (ACTUALLY AN EXTRA ONE) UNLESS YOU HAD A SPECIAL LATE SUBSCRIPTION, OR ALREADY PAID FOR 1985.

IN THE NEWS:

The January 8th issue of the N.Y. Times contained an article on Orphaned Computers by Peter H. Lewis, which gave us this wonderful little comment.

> The orphaned Timex, in contrast, seems to have already found greater glory. It was a so-so computer; now it's a state-of-the-art doorstop.

Steve Kaye wrote an indignant letter to Mr. Lewis and while obviously still "down" on Timex, Mr. Lewis provided a very nice article on our activities and Zebra's in the Tuesday January 22, issue of the Times. No space to publish this issue, but we'll reprint it in full in March.

from the Mile High TSUG newsletter

LIST GROUP
P.O. BOX 438
CENTERPORT, N.Y. 11721-0438

LONG ISLAND SINCLAIR TIMEX GROUP

LISTing Policy:

Annual Dues.....$15.00 Issue Price $1.50 (includes P&P)

One "Sample" copy sent upon receipt of large SASE.

Copies provided on exchange basis with other bona fide user groups.

L.I.S.T.ing is published monthly by LIST (Long Island Sinclair Timex) Group
a not-for-profit users group

Your reviews, programs, comments, hardware projects, etc., are eagerly solicited for publication in LISTing.

Please note our new address - P.O. BOX 438, Centerport, N.Y.11721-0438
Mail sent to the old address must be forwarded there and will take longer to reach us.

NOTE: PARTIAL YEAR MEMBERSHIPS AVAILABLE

Normal membership year is Feb. through Jan. at cost of $15.00.(US)
By keeping as many members as possible on that basis, we keep our costs and chances of error down.

If you wish to begin subscribing later in the year, please sign up for the end of this year and all of next.

We will accept partial years or different subscription runs, on a limited basis (particularly from members outside the U.S.) But, please be aware that, addition to possible rate increases, your "account" must be handled "by hand" and errors may occur. International (EX Canada) subscribers will receive as many issues as we can afford to mail.

POLICY ON CONTRIBUTED MATERIAL:

We are always looking for interesting articles, programs, reviews etc. to help keep our members informed and entertained. Articles submitted for publication are printed on the following basis:

1. You the writer, maintain the full copyright and can resell, lend or give away your work, as you wish.

2. We are granted the right to publish your material, in the original issue in which it appears. Reprints (e.g., to supply orders for back issues) will include your material as a part of its original issue. We are not allowed to sell your material in any other way, without your express written consent;

We can't (for now) pay you for your material, but you will recieve a copy of the issue in which it is published, even if you're not a member. You may get more than one issue and you will definitely earn the respect and appreciation by your greatful peers.

If you have a program or article about something you've tried, please send it in. Our group interests are so varied that I can almost certainly guarantee that someone else can use your expertise to solve his problem.

Excepts from the Spectrum Microdrive handbook

The MOVE statement

So far, you have only been able to move data from a program to a channel or vice versa. The **MOVE** statement, however, enables you to move data from one channel to another. For example, to move data from the keyboard to the screen, enter:

10 MOVE *1 TO *2

then:

RUN

Anything you type on the keyboard will now appear on the screen. However, you will discover that when you press **BREAK** this only prints a space on the screen. To escape from this trap, press **ENTER** until the print position reaches the bottom of the screen. Then, when the computer asks **scroll?** you should press **BREAK**. (You should, by the way, avoid moving data from the keyboard to any other stream since you may be unable to **BREAK** out of such a mode.)

Using the **MOVE** statement you can also examine files stored in cartridges. For example, set up the file "Numbers" (see page 23) and then, to examine its contents, enter:

10 MOVE "m";1;"Numbers" TO *2

(Note that you need not **OPEN** or **CLOSE** the file yourself. **MOVE** does this.)

Similarly, to make a copy of the file "Numbers" enter:

10 MOVE "m";1;"Numbers" TO "m";1;"Numbers 2"

Here, **MOVE** opens a stream for reading from the existing file ("Numbers") and another for writing to the new file ("Numbers 2"). Next, it reads the data in "Numbers" and writes it out in "Numbers 2". Then it closes both streams.

MOVE will work with stream numbers (such as *4), and with channel specifiers (such as "m";1;"Numbers"). Note, however, that the established streams, *1 to *3, may *not* be specified by the channel specifiers K, S or P.

If you have a second Microdrive, you can use the **MOVE** statement to make back-up copies of data in another cartridge. Enter:

10 MOVE "m";1;"Numbers" TO "m";2;"Numbers 2"

(Note that **MOVE** only works with data files. If you want a back-up copy of a program, you must **LOAD** the program, and then **SAVE** it.)

The extended BASIC

The ZX Interface 1 extends the BASIC already in the Spectrum. The extensions and additions are summarised below.

Streams

Streams are specified as * n where n is a number in the range 1–15. Streams 1, 2 and 3 are usually used by BASIC. The * character is part of the keyword for the **OPEN *** and **CLOSE *** statements.

Channels

There are seven types of channel in the extended BASIC; the keyboard (k), the screen (s), the ZX Printer (p), the text RS232 Interface (t), the binary RS232 Interface (b), the network (n) and the Microdrive (m).

Each channel type is specified by its letter which may be upper case or lower case. The network and Microdrive require additional information to specify the channel completely.

A network channel requires a station number, so a network channel is specified as "n";x where x is a station number in the range 0–64.

A Microdrive channel requires a Microdrive number and a file name, so a Microdrive channel is specified as "m";y;"name" where y is the Microdrive number in the range of 1–8 and "name" is a string of between 1 and 10 characters.

PROGRAM FOR AUTOMATIC SAVE,LOAD,VERIFY, FOR BASIC TASWIDE AND TASMAN INTERFACE

Here is a pair of utilities from Richard Cunningham. Lines 1 through 95 & 6000 through 9010 are for automatic SAVE,LOAD and verify of your program (in lines 100 to 5,000) and the Tasman utilities.

The remainer of the listed program is a list/data program. See Richard's letter for more info. Note that you'll need to dimension or establish R$ as the name of your program or data set.

PRACTICAL MICROCOMPUTER APPLICATIONS

FOR THE PAST TWO YEARS I HAVE BEEN USING MY HOME COMPUTER SYSTEM TO HELP ME COMPLETE MY TEDIOUS CLERICAL CHORES AND HAVE ALSO USED IT FOR THE PREPARATION OF STUDENT EXAMS AND IN SCHOOL FOR SPECIFIC SCIENCE LESSONS WHERE THE STUDENTS COLLECT AND ANALYSE NUMERICAL DATA.

MY COMPUTING EXPERIENCE STARTED WITH A COURSE IN FORTRAN PROGRAMMING AT N.Y.U. SEVERAL YEARS AGO. WHILE I FOUND THAT LANGUAGE VERY CUMBERSOME AND DIFFICULT TO WORK WITH I LEARNED HOW A COMPUTER CAN BE USED TO MANIPULATE DATA. I WAS LATER EXPOSED TO MICROCOMPUTERS AND I WAS AMAZED AT THE SIMPLICITY OF PROGRAMMING AND WORKING WITH THEM. ONE OF MY FRIENDS HAD BUILT A COMPUTER SYSTEM BASED ON THE INEXPENSIVE TIMEX SINCLAIR MACHINE AND I LIKED SOME OF ITS SPECIAL FEATURES. SINCE THAT TIME I'VE BEEN SLOWLY WORKING ON DEVELOPING MY OWN SYSTEM WHILE USING IT FOR MANY PRACTICAL APPLICATIONS CONNECTED WITH TEACHING.

the hardware

a)Computer-Timex Sinclair 1000
b)DK'tronics keyboard
c)64k ram memory
d)Timex Sinclair 2040 thermal printer
e)Standard b/w t.v. and cassette recorder
f)Westridge 2050 modem (at home)

the software

L I S T GROUP

February 1985

NEWS NOTES : Library tapes are being generated about 2 X/year. Tape #2 (The first for 1985) is due out in February. Response to tape #1 was quite good and the programs on #2 cover over 30 minutes worth of tape.

HEADER READER-TS1000

This program lets you scan the name you have given to your TS1000 programs.It is adapted from "Explorers Guide to the ZX81 and TS1000" by Mike Lord. This vastly underated book is probably THE most valuable addition to your TS1000 library. This unique book contains both harware and software articles, that are not published anywhere else. Explorers guide does not fit the category of a "me too" book. The descriptions of the ZX-81 display hardware/software is of such detailed nature that it is my guess that Mr. Lord either worked for Sinclair or had some contacts there. Buy it before it goes out of print.

I Have included a minimal loader program to enter the 66 byte code into the rem statement.

First create a rem statement with 66 or more spaces. Then enter enter lines 10 through 200 of listing 1. Enter the code from left to right. When you are done and sumcheck is verified to be 7620, delete lines 10 through 200.

Enter lines 20 through 110 of Listing 2.This is the program you will save and use. The program will auto run after a save and prompt you to load your tape, it will then print on the screen the title it finds.

LIBRARY TAPE DOCUMENTATION STILL NEEDED: We still need someone to write up detailed operating instructions for the tapes. Contact Chuck R.

REVIEWING NEEDED

We have some software packages which need user reviews. If you are interested in Investment, money management programs, or a 2068 compiler, and will write a review, please contact Paul D.

Also needing reviews for TS 1000: - a Data base, info retrieval package.
For Spectrum: - Various games

from the Nile High TSUG

RALPH SMITH ALSO INDICATED A NEED FOR A CAD PROGRAM FOR 2068. DOES ONE ALREADY EXIST ? WE HAD A LONG MEETING LAST MONTH DUE TO ALL OF THE H/W AND S/W ADS AS WELL AS THE NEWSLETTERS THAT WE NEEDED TO COVER. THERE IS STILL SUPPORT OUT THERE FOR US OUT THERE. HEINZ WAS ASKED IF HE WOULD TAKE NOTES ON OUR MEETINGS AND HE AGREED. WOULD YOU BELIEVE HE SENT ME 3 TYPED SHEETS BEFORE HE LEFT FOR CHICAGO ? THANK YOU. HEINZ. WE WILL TRY TO FINISH UP BY 9 30 PM IN THE FUTURE.

Ralph - Check with Zebra Systems

SOFTWARE? REVIEW:

ITEM:	SPECTRUM COMPUTING MAGAZINE
FOR:	SPECTRUM OR TS 2068 WITH ROM OR EMU
PRICE:	£3.99
FROM:	APS LTD, 1 GOLDEN SQ, LONDON WIR3AB

Spectrum Computing is a "magazine" in tape format, similar in some ways to 16/48 magizine. After loading a cute, but somewhat busy little screen, the index (shown above) is listed. The programs are chained; that is, each one loads the next automatically when finished, but can be loaded separately if loaded by name.

The first article is an editorial piece about the new "fastloading" sofware for the Spectrum. The editor states that many new releases include a short loader program which is usually a speeded-up version of the standard Spectrum tape LOAD routine. This cuts loading time significantly (say from 4 min. down to 2), but because of the higher Baud rate and consequent higher frequencies, often leads to LOADing errors or crashes. In his opinion, the "fastload" routines are merely an effort to defeat tape-to-tape copiers and end up making even the originals hard to load. He asks the software houses to cease and desist.

Next comes "Chopper", a pretty much standard "Choplifter" (Defender) type game program. You fly a rescue chopper into oncoming balloons and jet planes, in an attempt to pick up stranded "survivors". The graphics are adequate and response is reasonably good. The singular variation from the standard game is your lack of guns. To give you a frame of reference, I'd say that if Penetrator was worth $10.00 (in the UK) this game would be worth about $4, commercially. As a program published in a magazine though, it is not bad, at all.

A series of software reviews follow "Chopper", these cover arcade or adventure games exclusively and seem to illustrate Spectrum Computings overall style. The reviews are irreverent, perhaps even acerbic at times, and of course, cover only "lightweight" or game software. Compared to 16/48, Spectrum Computing is a bit of a "lightweight" publication, as well. The programs reviewed in the first section include the Inferno, Full Throttle, Battle Zone, PYJAMA and Zombie. Each has two pages of text and offers one actual graphics screen from the reviewed program.

To give you an idea of the reviewers style, I'll try to provide a review of this review of Inferno; written in his own style:

"It's hard to believe this reviewer is serious. He claims "the Inferno" is probably a lot like "the Hobbit", and should be a big hit with adventure fans".

Is he kidding? He admits he's never seen the Hobbit! And he's still trying to make a comparison. Give us strength!

On top of all that, the actual program used for all 5 reviews is written in pissant BASIC. That's that peculiar U.K. version of memory - saving code which makes listings almost incomprehensible to all but the most experienced programmer. Stuff like PRINT LINE (PI*VAL"X") are ridiculous, and probably not necessary as well. A line like the one I just made up probably saves only a couple of bytes of code, anyhow".

Don't get me wrong. The reviews are not bad, just not good. The last item in the section of the magazine is perhaps an even better indicator of that "lightweight" stigma I applied earlier. PRANG'S TWIDDLER is purported to be an attribute twidding utility. It does twiddle the attributes in some cutesy ways, but I defy any novice programmer to use it. The programs internal documentation, in a few REM statements, is abysmal.

The second section of S.C. is pretty much, "more of the same", though the "Cartoon" is pleasant to watch. To sum up, there is good value for money here, just not as much as there is in "16/48". The best comparison I can make, is to liken 16/48 to "Your Computer" or "ZX Computing" (lately) while Spectrum Computing is more like "Sinclair Programs" or perhaps "Sinclair User".

Technical Report:

Yes, this Illustration was missing from last month's issue!

Modified Power Supply Schematic Diagram - with 7805 external to Computer

Here's our third installment from Jess Peeler.

Power Supplies - Problems

1. Once in a great while, you get a noisy power supply. In such cases, the bridge rectifier is first suspect. (A power supply can still partially function with 1 or 2 diodes bad - but it will be noisy!) You must crack open the power supply case and find the faulty diode(s) and replace them with 1N4002 diodes. I've never seen a capacitor fail, but it could and the replacement is a 1000 mfd/16V capacitor.

2. I recommend cracking open the power supply whether there is a problem or not. I then put a miniature SPST switch in series with the output so that I can kill power at the power supply, rather than pulling the plug at the computer.

3. To avoid drop-outs due to looseness of the power supply plug, I remove the power jack completely. (Desolder it and remove.) I then hardwire the power wires in place, tack them securely with some silicone rubber and the power drop-out problem is completely solved. For an even neater job, one should consider putting a small male and female connector near the power supply to disconnect the system. Watch that you don't reverse polarity!

4. Where I live, heat is not a problem. However, based upon the vast amount of letters and complaints seen in Sync and Syntax, heat is a problem for many and the logical solution - the only one I've not seen presented - is to get the primary heat generator outside of the computer case, like so:

a. The primary heat generator is the 7805 3-terminal 5 Volt regulator. The higher the input voltage applied to this device, the more energy which must be dissipated in heat by this device to reduce the output voltage to +5 volts.

b. The input voltage (From the external power supply) varies from a high of 11+ volts down to 7 volts. The variation comes about primarily due to the amount of add-ons which are connected to the computer. Each device added pulls more current - which causes voltage to drop. (Should you add too many external items, say with a 750 ma. power supply, the response would be too high a current drain, voltage would drop too low, and the computer would just quit functioning.)

c. De-solder the 7805 regulator and remove it - also the aluminum heat sink. Now, combining with (3., above) connect a 3-wire input to the computer. Three wires are now needed because not only do we need a +5 volt and ground (return) line, but we need the un-regulated line which provides between 7 and 11 volts - for use by the external 16K RAM. (See figure A) Page 4

d. Mount the 7805 regulator - with a good heat sink - to the external power supply. Use silicone rubber to mount the heat-sinked 7805. Now rig 3 lines via a 3 wire plug and jack to provide variable D.C. (7 - 11 volts), regulated +5 VDC and ground. Don't forget to put a SPST miniature switch on the external power supply.

SIMPLE T/S 2068 OUT PORT
(Part 2)

As stated in part 1, the outputs of the Port or latch can drive LEDs directly however. it would be preferred to isolate the output circuitry using optoisolaters. Refer to diagrams.

1- An optotransistor with a Darlington pair and an LED can be used to drive a relay directly.

2- An optothryristor can be used for controlling half wave AC line circuits such as, lights, pumps, valves and motors .

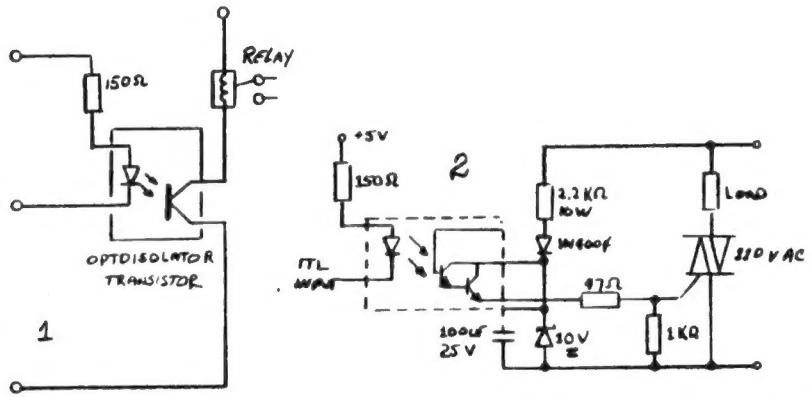
3- Optodiac/Optotriac devices can be used to drive simple AC line circuits directly or with an additional Triac for heavier AC line applications.s

The Port circuit can be connected to eight (8) opto devices since their is adequate power from the 5 volt computer power supply. External circuits driven from opto devices should contain their own power supply to prevent overloading the computer.

An alternative device which can be used safely as an interface between the computer, Out Port and external low-voltage DC circuitry is the V-FET or VMOS transistor. This is a high current Field Effect transistor (FET) that acts very well as a high current switch to operate DC motors such as in a train set control application or prehaps in Robotics and motors or servos. Thyristors and Triacs are AC devices which do not switch off under DC conditions, whereas the V-FET will switch on and off like a relay with the load being connected in the Drain or Source circuits in series with the transistor. A V-FET which can switch up to 2 amps is the VN 46AF. This V-FET can use DC voltages up to 40V and is rated at 15 Watts.

The Out Port can be constructed using the PC board available from MAPLIN ELECTRONICS LTD; ENGLAND or from a section of multi-purpose perf board (ZEBRA) using point-to-point wiring or wire wrap techniques.

The relay board or opto drive board should be separate from the Port board since they will probably drive some sort of 110V AC devices. Double check all 110V connections for adequate insulation and/or shorts between the output circuitry.



Diagrams: 1-Optoisolator (Transistor), 2-Opto-Darlington pair

TESTING

Without the Port connected to the computer and with out any power present, check all connections with an ohmeter or continuity tester for shorts or open connections. If everything is OK, connect the Out Port to the computer and apply power. The computer should display the normal copywrite message at the bottom of your monitor screen - if not, shut off the computer immediately and recheck all wiring. If all is well, a voltmeter check from each latch output should read a logical 0; almost 0V.

Type in: OUT 31,255, then ENTER. All outputs should go high (logic 1), about 5 volts DC. Any relays connected to outputs will energize and opto devices will drive their respective loads.

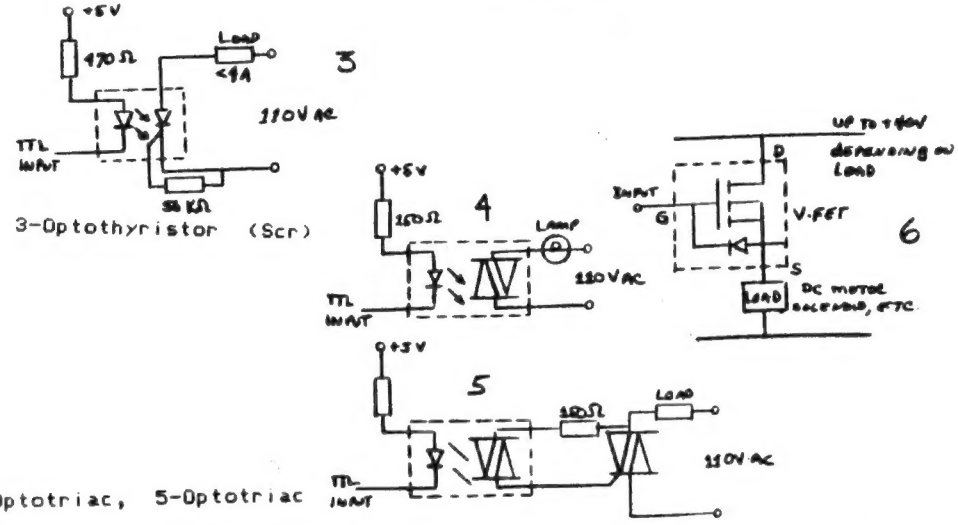
To call each port (latch), use the following:

```
OUT 31,1........Latch 1
Out 31,2........Latch 2
Out 31,4........Latch 3
Out 31,8........Latch 4
Out 31,16.......Latch 5
OUT 31,32.......Latch 6
OUT 31,64.......Latch 7
OUT 31,128......Latch 8
```

If a combination of two or more Ports are required, use BINARY for the required number to activate multiple devices:

```
OUT 31,3........Latch 1 & 2
OUT 31,255......Latch 1 thru 8
OUT 31,7........Latch 1, 2, & 4
and so on.................
```

.....Bob Gilder

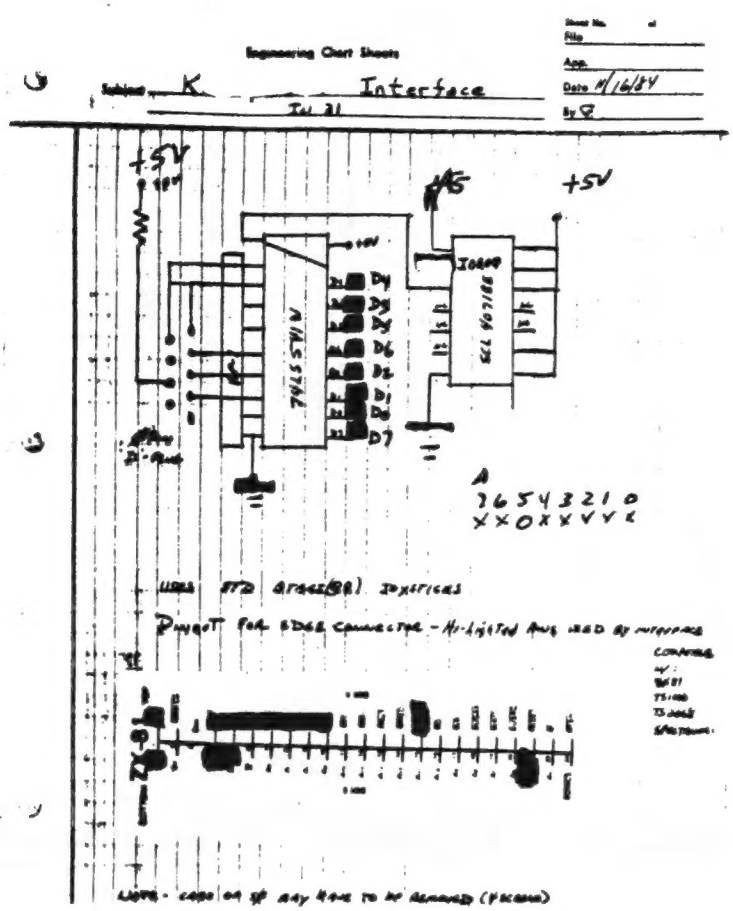


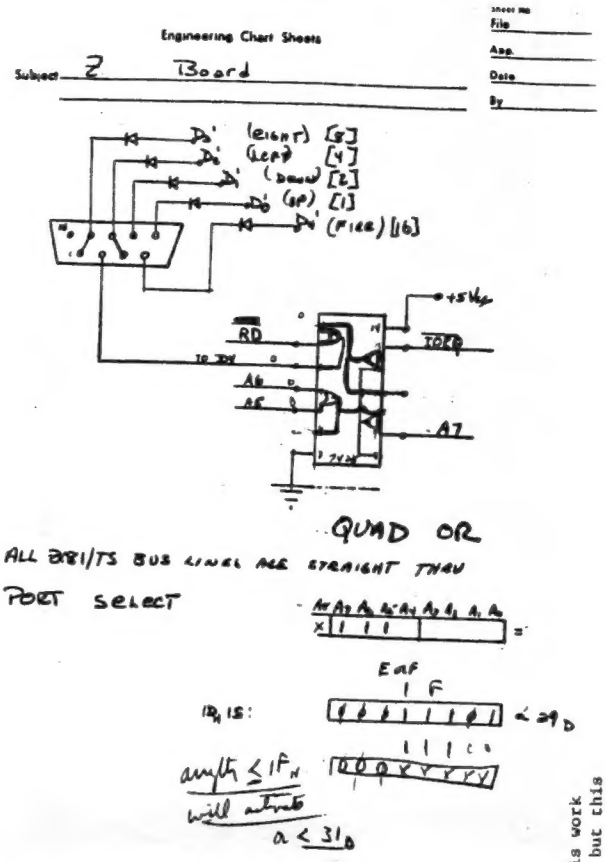
3-Optothyristor (Scr)

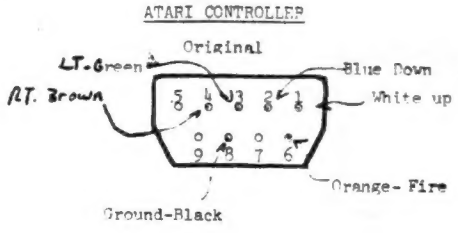
4-Optotriac, 5-Optotriac with an output triac driver, 6-A V-FET

LIST GROUP

JOYSTICKS

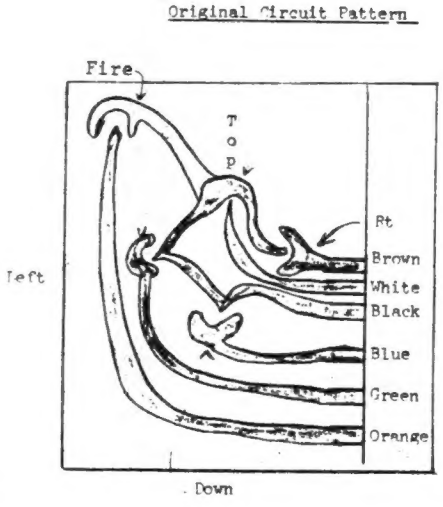






Only ● has contacts

Uses Quik
Connect Terminals
For Edge Connectors



These joysticks will work on, 2068, ZX81 & TS 1000. "K" models work on Spectrum as well and "Z" models should work with Spectrum, but this has not been tried. Note too, that while the "Z" model was downrated somewhat for poor decoding (only 3 lines used), the "K" board only uses A5, even less effective decoding.

Here are some scratch notes on the 'K' and 'Z' joysticks. Both will respond to IN 31(d), but with quite different results. As you can see, the 'K' joystick interface pulls the data lines up, while the 'Z' pulls them down, when the switches in the joystick are closed (made).

It shouldn't be hard to made a "K" out of your 'Z'. Remove the diodes (and replace with pull down resistors, 10K perhaps) and put an inverter on the output of the QUAD (Pin 3). D4 still seems to be FIRE, but the other lines need either be rerouted, or you could rewire the joystick by repositioning the Quick connect terminals inside it.

NOTES:

1. This modification will only work with EMU-1, EMU-2, or the new OMNI-EMU (with EMULATOR EPROM) installed in dock cartridge port. ROMs and ROM-based systems need additional circuitry on the interface and inside the 2068.
2. This interface circuit is compliments of Roy B. Perschy, 110 The Village # 503, Redondo Beach, CA 90277 (213)376-2740
3. It might be wise to use some bypass capacitors around the 9 volt and 12 volt regulators.
4. Contact either Roy or Doug Dewey about the availability of this interface--both are working on one, as is Zebra Systems.

RGB MONITOR

We've all heard that RGB monitors provide a much better display than that which our 2068's put out on Channel 3 or monitor output. Having just purchased Sears RGB monitor/reciever , I can testify that the difference is breathtaking.

I used Timex's sync stripper circuit, mounted on a Radio Shack project board, to make sure the sync levels to the Sears Monitor were up to snuff. Bob G. feels I could have tried to send the composite video directly to the composite sync input and gotten good results. Theoretically, that won't work because the sync circuits on the monitor are "supposed to be" looking for 5 volt (TTL) level signals and composite video is usually only in the 1 volt range (a 0 signal to TTL). It works on Bob's Hamtarex monitor, because the circuits sensitivety can detect the "black" sync signals. The Sears may be sensitive enough, as well, and you may want to try it. I had already built the board into my cable, so I used it.

You can make the cable yourself, as I did, or buy a commercial "IBM PC" cable. These latter sell for from $10 to $20, depending on source. Follow Bob's instructions for Internal RGB output using a 9 pin 'D' connector on the back of your 2068 (see back issue of LISTing). Your best bet is to follow IBM's "standard" pinout on the computer connection as this will allow the use of the standard cable. It cost me more to "roll my own" than I could have paid for a commercial cable (Delivery was the main problem), and mine is not IBM compatible as I didn't know their pinout for the 9 pin plug.

The accompanying Illustrations on this page give the pinouts for the monitor, the Timex sync circuit and other helpful info.

Phil McConaghey wrote in to tell us how he hooked his monitor up using Brown's RGB adapter. His note is provided below.

The young arcade aces around here used to think Jet Set Willy was one of the best arcade adventure games around. Now that they've seen it in RGB (the brightness artifacts are gone, as well as all the "wigglies"), they would play it all day - every day, if we let them. About the only disappointment is the "phony" 64 column mode programs. Those 3 dot wide characters look worse, now that I can really see how they're done.

I highly recommend the Sears monitor receivers, especially at the $319.00 price.

MONITOR FOR TIMEX 2068

BY PHIL McCONAGHEY

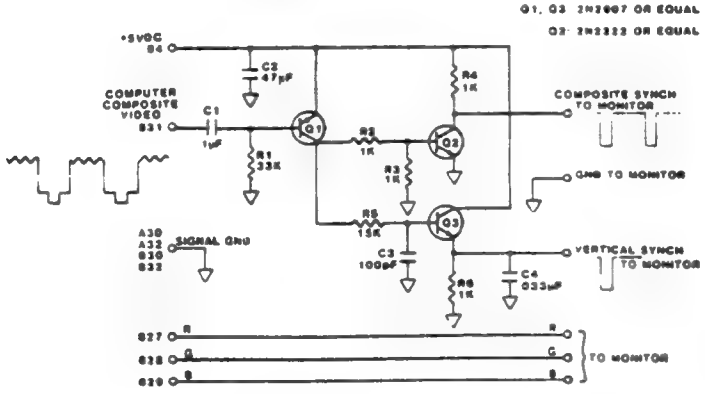
I purchased a Model No. 4084 from Sears, Roebuck & Co. ($344.00 including tax) together with RGB Cable Model 6539 ($18.00). After modifying my computer using an RGB Conversion kit #220-453 from E. Arthur Brown Co., 1702 Oak Knoll Drive, Alexandria, MN 56308 ($19.95). This requires opening the computer and doing some soldering inside. Then I connected the wiring as follows:

CONVERSION KIT CABLE	RGB SEARS CABLE
Brown	Orange
Red	Red
Orange	Brown
Green & Yellow	Bare wire
White	Green
Black	Blue
+ 5 volts*	Yellow

*Run a separate wire (not included) connected to the +5 volts location shown in the instructions for the RGB Conversion Kit.

Try out the new system by entering BORDER 0. If the edges of the display have the wiggles or the screen goes blank, open the computer and adjust the Horizontal by turning the "VRI" located in the bottom left side and/or the "C5" which is at the middle upper right part of the Board.

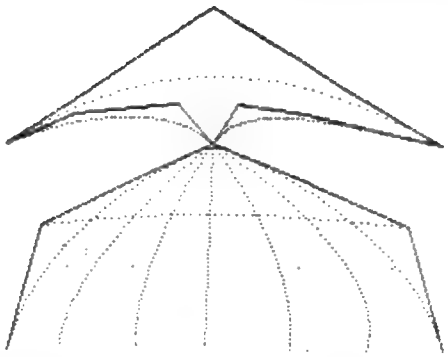
I now have fantastic clearness and color. I noticed Sears has this monitor on sale recently for $319.00.



SCHEMATIC FOR RGB MONITOR CONNECTION

THROWING A CURVE

P. BINGHAM



"CURVE" AND "curve" ARE BOTH THE SAME BUT THE FIRST IS A GREATLY ENHANCED VERSION WITH 3 MENUS & SOME M.C. INCLUDED. WHAT THEY BOTH DO IS TAKE A BUNCH OF STRAIGHT LINES (I CALL THIS THE FRAME) AND PUT IT THROUGH BEZIER'S FRENCH CURVE FORMULA TO ROUND OUT THE EDGES.

THIS WAS ORIGINALLY A PROGRAM FOR THE APPLE II COMPUTER BUT I'VE TRANSLATED IT TO ZX80, ALTERED ITS FUNCTIONS, WRITTEN NEW ROUTINES, AND SPEEDED IT UP SO NOW IT HAS LITTLE IN COMMON WITH ITS ANCESTRY. IT IS A GREAT PROGRAM TO PLAY AROUND WITH. YOU CAN SPEND HOURS & HOURS GOOFING AROUND WITH IT.

"curve" IS SHORTER AND WILL GIVE YOU A FEEL FOR CURVE PLOTTING WITHOUT LOTS OF TYPING. BUT "CURVE" LETS YOU STORE, ALTER & SUPERIMPOSE AND IS HANDIER FOR FOOLING AROUND WITH THE ARTISTIC TALENT LATENT IN US ALL.

I'LL PROVIDE A BREAK-DOWN OF THE MENU FUNCTIONS AND A FEW HINTS & TIPS, THEN THE PROGRAM WILL SPEAK FOR ITSELF.

FOR LONGER "CURVE" PROGRAM

OPENING MENU:

- cls – CLEARS SCREEN
- copy – COPIES PICTURE TO PRINTER (ZON10)
- continue – GOES ON TO MAIN MENU (MM)

MAIN MENU:

- begin – STARTS INPUT SEQUENCE TO START NEW DRAWING (LINE 100)
- alter – SENDS YOU TO ALTERATION MENU (LINE 200)
- store – M.C. SENDS SCREEN TO HIGH MEMORY LOCATION (LINE 300)
- quit – STOPS PROGRAM AT LINE 400

ALTERATION MENU:

- list – LISTS BY CORNER ALL (X,Y) COORDINATES OF LAST DRAWING
- fix – LETS YOU ALTER ANY OR ALL COORDINATES OF LAST DRAWING
- old – DISPLAYS WHAT IS IN HIGH MEMORY STORAGE WITH M.C.
- both – AS WITH OLD BUT THEN SUPERIMPOSES LATEST DRAWING
- MM – TAKES YOU BACK TO MAIN MENU (LINE 20)

HINTS & TIPS: (MOSTLY FOR LONGER VERSION)

1. THE VALUE OF "a" IN LINE 10 CAN BE CHANGED HIGHER FOR MORE POINTS PER INCH ON EACH CURVE OR LOWER FOR LESS PER INCH. THE FEWER, THE FASTER THE PLOTTING. THIS GOES FOR BOTH VERSIONS.
2. FEEL FREE TO CHANGE INK COLORS IN LINES 40, 240, 300, 320 AS YOU LIKE, AS WELL AS BORDER & PAPER.
3. IF YOU QUIT ACCIDENTALLY JUST USE GOTO 40 AND NOTHING IS LOST.
4. IN SHORTER "curve" PROGRAM A GOTO 100 WILL LET YOU PLOT AGAIN AND AGAIN WITHOUT LOSING YOUR SCREEN.
5. YOU MAY CONNECT THE BEGINNING & END POINTS IF YOU MAKE THEM THE SAME COORDINATES. A BLANK SHEET OF PAPER COULD HELP HERE.
6. YOU ARE ABLE TO HAVE LINES CROSS AS WELL BUT MORE THAT ONE CROSS CAN GIVE UNUSUAL SCREEN RESULTS.
7. LINES 510 TO 640 IN BOTH VERSIONS CONTAIN THE BEZIER FORMULA. A PERSON MORE VERSED IN MATH MIGHT BE ABLE TO REWRITE THIS FOR SPEED.
8. THE CONTENTS OF THE 1 REM START OUT AS 25 "X"S. THEN (AS SHOWN BY ADDRESS) EACH VALUE IS POKED IN THEIR PLACE. THERE ARE 24 VALUES AND 25 "X"S – WHY? I ALWAYS AM MAKING MISTAKES; THIS IS JUST A PRECAUTION IN CASE I MISS!
9. CAN ANYONE ADD A SCREEN SAVE FUNCTION? RIGHT NOW STORAGE BEGINS AT 57167 AND IS 6143 BYTES LONG. RAMTOP IS SET JUST BELOW THIS BY LINE 10.

I HOPE EVERYONE OF YOU HAS AS MUCH FUN WITH THIS AS I HAVE.

— Paul (Bingham)

MAKE-A-CHIP - Is an excellent educational package which lets you design and test logic circuits. You may recognize the circuit from your TS 2068 schematic. (FOR SPECTRUM)

TEST GROUP

COMMUNICATIONS

FROM ZX/TS FORUM (THROUGH MARTY J.)

Yes you can open/close your friends buffer and even ring his bell!
All you got to do is:
1:PRESS SYMBL SHIFT and CAPS SHIFT togetter
2:HOLD THE TWO SHIFTS DOWN and press:

R:to open his buffer
T:to close his buffer
G:to ring his bell

One more thing,when your computer asks you for "PROMPT STRING?"or "CHARACTER DELAY?"
Just hit the ENTER key.This is simpler way to send a program.

Tasword II

This is Tasword II, in the 64 column mode. I think it looks pretty good on my Sears RGB monitor. So far, I can type in these comments about as fast as I like, while using the standard "Sinclair" editing proceedures, as I go along. That's a good feature, I think, for those of us who've grown up on these techniques.

I haven't looked up at the results yet, as I want to see if we get "free" word-wrap. When I do, I'll probably fix my mistakes, anyway. I think, for example, that I put in commas for apostrophe's(I did, and I'm using the insert function(the HHD key) to tell you about it now) in the first paragraph. I'm going back now to try to fix this up. Let's see if I can do it without the manual.

New para. Well, I'm impressed. Not only did I get word-wrap, my text is justified. I'm beginning to see why this package is the rage in the U.K., and why Sinclair Research provided it as part of my Microdrive package.

Next para. Time to try the EDIT mode. The HELP menu, reached by entering EDIT, as shown in the command line at the bottom of the page, has given me all the commands I needed to fix up the mistakes I made in the first paragraph, and, to insert the double parenthetical expression in the second, which tells you that I succeeded.

I'm TABing manually, but let's see if there's an auto TAB function... Well, You can't have everything. Of course, with auto repeat on the space bar, that's not really a big problem.

There are some other nice word processor features which TWII lacks, but they are fairly sophisticated, infrequently used, and found only on the most expensive MP's. Tasword II will satisfy my needs, and those of most users and moderate intensity writers, like myself, at a very reasonable price(the Spectrum version is available for as little as $15.00 if you know where to look). TWII gets a "10", perhaps the first I've ever given, both because it is cost effective and is simple enough to use without a manual, for almost anyone who's used even the simplest word processor before.

basicode-2

elektor october 1984

Changes and additions to broadcasting schedules

In our October, 1983, issue we published two articles on 'basicode-2' (pp. 10-27 and 10-51). In the first of these we mentioned that basicode programmes are broadcast during the Hobbyscoop programme. As from 7 October the broadcast times on medium waves change to 19.10 — 19.15 (British time) on Hilversum 5, 1008 kHz, every Friday. The main programme, which is no longer transmitted on medium waves, can now be heard on Thursdays, commencing 25 October 1984, according to the following schedule (all times in GMT). M

Australia/New Zealand	07.50	9770 kHz 9715 kHz	Western Europe (cont'd)		15 560 kHz
	10.50	9650 kHz		13.50	5955 kHz 6020 kHz
South East Asia	14.50	11 735 kHz 17 605 kHz 21 480 kHz			9895 kHz 11 935 kHz 17 605 kHz
Africa & Southern Europe	18.50 20.50	9540 kHz 9540 kHz 11 730 kHz 11 740 kHz 15 560 kHz 17 605 kHz	Eastern North America	18.50 02.50	6020 kHz 9540 kHz 6165 kHz 9590 kHz 9895 kHz

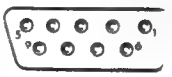
RS232 connections

Interface 1

The RS232 socket is wired as follows:



1. No connection
2. TX data (input)
3. RX data (output)
4. DTR (input) this should be high when ready
5. CTS (output) this should be high when ready
6. n.c.
7. Ground (pull down)
8. n.c.
9. +9v (pull up)

An RS232 cable is available from Sinclair Research, which connects the 9 way D-socket to a 25 way D-plug (25 way D-sockets are common on RS232 peripherals). For details of how to obtain this cable, see the software and peripherals catalogue included with the ZX Interface 1. This cable is wired as follows:

2. TX data
3. RX data
5. CTS
6. +9v (normally DSR)
7. Ground
20. DTR

LETTERS TO LIST

CHICAGO, Illinois 60605

2 December 1984

Dear Mr. Donnelly,

The 10 December 1984 issue of Infoworld magazine, p.22 states that an American Timex 2068 computer can be converted to run British Sinclair Spectrum software, presumably using an American television as a monitor. Can you please send me further information about this and about the Long Island Sinclair Timex Group.

I recently moved to Chicago from London and did not bring a Sinclair Spectrum with me because it would not work with an American television, and did not buy a Timex 2068 because it would not run British software. I will appreciate any information you can send me

Yours sincerely,

(Donald Kay)

11/28/84

Dear Paul -

I am a T/S 2068 who had all but given up hope for any support. I bought the 2068 just in time to see SYNC magazine go down the tubes (after subscribing, but fortunately not yet billed) and Timex shut down the 800- info line. I was lucky enough to get a 2040 printer and the Technical Manual, but the only piece of software I found was a little spread-sheet called VU-CALC. It was refreshing to read of your existence in Infoworld (12/10/84 p.22), which has renewed my fantasies about software & peripherals.

Please send me membership materials and other relevant information. I am...

George Lem, Jr

Glassboro NJ 08028

P.S. - Are modems still available? Does your group have an electronic bulletin board? Looking forward to hearing from you.

November 30, 1984

Dear LISTG:

Suggestion for alternate character set: UNGFON - written about in August 81 and 82 Science Digest.

Please send sample of newsletter and list of public domain software for 2068, if possible.

Was it an isolated case or was it by design that no cover letter was included with the QL brochure recently sent by Sinclair Research? Photos were lighter and programs were referred to in their generic sense. Qlub dues rose from $30 to $50 from the previous brochure. What was missing was a cover letter. One that might have said, "QL in stock, call 1-800 ..." or one that read, "$100 trade-in on your 2068 when you buy a QL." Perhaps, "QL price reduction, now only $350, call..." Or even, "Free Qlub and 68000 assembler if QL purchased before..." Unfortunately, no cover letter was found. Was it an oversight? Was it planned? Are current owners of Sinclair products valued by Sinclair? Makes one wonder. All the more so since Sanyo can be bought for $640 with a disk drive. Disks now run $1.23 from Quill in quantity 25. At this rate, the QL may remain a European phenomenon.

Sincerely yours,

Chuck Trier

Dear sirs:

Mine is a story which you've heard countless times before, so I'll make it brief. I joined the Sinclair computing phenomenon back in the days when you could only buy a ZX81 thru the mail. I have since been sufficiently impressed with my "Z" to add 64K, a mounted keyboard, a TS2040 printer, and more software than I have time to use. For the past year I have also been the happy owner of a TS2068 Color Computer.

I used to have a subscription to SYNC...

Even though Timex has tried its best to destroy the T/S product line (I refuse to buy any more of their goddamn watches..) I am still impressed with my computers and would like to continue to use and enhance both of my systems, hardware and software alike. I'd like to see the T/S computers become the most popular "obsolete" computers since the TI/99-4A.

As a D.P. professional, I intend to develop and market software for the 1000 and 2000 machines. I would appreciate any information or advice you might give me to help me in my endeavor.

As a T/S user, I would also like to join a Users Group to help me keep in touch with developments. Please consider me as a likely candidate for membership. Enclosed is a SASE whereby you may send me membership info.

I hope to hear from you soon!

[illegible]

Mr. Paul Donnelly
Secretary-Treasurer
Long Island Sinclair-Timex Group
P.O. Box 438
Center Port, NY 11721

Dear Mr. Donnelly,

Please send me more information on how to place the Sinclair Spectrum Read Only Memory in the Timex 2068. Also, would you please indicate whether there is an interface by which I can connect my 2068 to my Zenith Z-89/90 or my North Star Horizon.

Please find enclosed a self-addressed stamped envelope for your reply.

Yours very truly,

Malcolm H. Aukerman

Newport, IN 47966

NY NY 10025

DEAR MR DONNELLY,

I JUST READ ABOUT YOUR SINCLAIR GROUP IN INFO WEEK AND I WAS WILDLY EXCITED ABOUT THE POSSIBILITY OF CONVERTING MY MACHINE TO RUN BRITISH SOFTWARE. COULD YOU PLEASE TELL ME MORE ABOUT THIS. ALSO I WOULD LIKE MORE INFORMATION ABOUT NEWSLETTERS, MEETINGS, PUBLIC DOMAIN PROGRAMS AND MEMBERSHIP.

THANK YOU,

HAL ZUCKER

LIST [illegible] S-T Group
P.O. Box 438
Center[illegible] [illegible]

Gentlemen:

I read of your group in a recent edition of I[illegible]. I would like further data concerning membership and your activities.

This is being written with the aid of TASWORD II. I am quite pleased with it [illegible] that I am considering getting the [illegible] parallel interface connection [illegible] an appropriate dot-matrix printer. [illegible] any information [illegible] interfaces and printers [illegible] be greatly appreciated.

Also desired is information [illegible] applications for [illegible]. I am not a [illegible] it must be quite a [illegible].

Has there been [illegible] the unfortunate [illegible] shift key [illegible] the right hand [illegible] shift [illegible] the break key [illegible] great help both in [illegible] in entering numerical data [illegible] the keyboard.

I look forward to your response.

Sincerely yours,

[illegible]

LIST GROUP

LETTERS TO LIST

Long Island Sinclair Timex Group.

DANBURY, CT. 06810

December 6, 1984

Dear Paul,

I learned of your Group from a recent write-up in Infoworld magazine and was intrigued by the reference to placing the Spectrum Rom in the TS 2068. Would you please send me more information about this, and your group.

As an owner of both a 2068 and several Spectrum programs on tape I have had limited success in getting the latter to run since many cannot be listed to allow changes to memory addresses etc. I have no problem with printed material from books and magazines – just the tapes.

For what it's worth Manic Miner and Jet Set Willy run well on the 2068, and give hours of fun. Good English programs are not confined to games however (and thank God!) and it would be terrific to be able to use them

Thank you

P. Jennings

(PETER JENNINGS)

12-1-84.

Mr Paul Donnelly,
Sinclair Group

Dear Sir,

Read about your group in InfoWorld just as I was about to drop my 2068 in the trash. Please send membership details, you are my last hope.

Also info on Spectrum conversion, as I have just received brochure from a Mr. E. McGhee of Canada, at a $800 higher price.

Thank you,
Edward [illegible]
Kalamazoo, Mich. 49008

Dear Mr Donnelly –

About the note in Infoworld:

I'm most interested in the Spectrum Rom – as well as your newsletter – the 2068 is a good machine – and it's groups like yours that will extend its life.

Please send me any information – about the club – the Rom – the newsletter –

Thanks very much,

[illegible]

LESTER M. SACHS

Dear Timex Users Group:

Several of us in the Baltimore area, TS 2068 owners, wish to form a users group. We would like to draw on the experience of other users groups so as not to make the same mistakes. We would also like to maintain contact, trade notes and software.

I am typing this letter using the Tasword Two program and am happy to report that it is quite good, particularly at its selling price.

I am seeking a program that will make use of the 64 cpl mode of the 2068 and will support the AERCO interface. The Timex Technical manual lists subroutines in Appendix C, but I am told that they were never checked out. Can you help? The AERCO Centronics interface works well when the proper pokes are applied.

Yours truly,
L. Sachs

LETTERS TO LIST

Here are some letters to LIST - We get many more often asking the same question. A Corresponding Secretary could answer these and send our sampler to new inquirers.

Most of the letters you see here have been answered, albeit briefly, with some scribbling on the first page of the sampler package. I don't know that my quick answers will do any good, though.

As examples of what should have been said (all were sent sample packs and a short note):

To Donald Kay – You've been sent sample LISTing Pages which describe the emulator and ROM use. Can you get us Software/Hardware through contacts in UK? Do you visit?

To Mike Leidel – Glad to hear of your steadfastness - info sent.

To Malcolm Auckerman – RS232 would do the trick. You'll need software though.

To Ray Potter – Subscribe - R. Cunningham and R. Gilder have virtually a continuing series on this set up.

To Peter Jennings – You need a ROM or emulator.TS2040 and with Aercos or Byte Back interface; any printer.

To Ed Cocchio – Ed,ROM's are even cheaper in U.K. My markup ($18.00 to members), and even I consider it high, is just lower than his.

To Walter K – Your back issues are on the way - we'll publish more ZX81 articles too - If someone sends them in.

To Ray Blum – Talk to Zebra - can you write an article for us?

Dennis Lienhoats – Buy the DK'Tronics keyboard from them £45-should get it to you for $50.00 including shipping. They take Visa.

Lester Sacks – Jeff Streets word processor may help you. Also look at the ads in TS Horizons,Syncware News

Roy Potter (MAGIN) – You can use Aerco's interface as well. A hand wired big Keyboard would work. Your letter was practically ruined by heat during its stay with USPS.

DEAR SIRS,

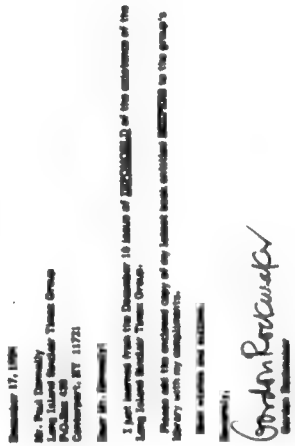
COULD YOU PLEASE SEND ME INFORMATION ON THE ARTICLE (REPRINT MAYBE, OR PERHAPS A BACK ISSUE?) MENTIONED IN THE FOLLOWING MESSAGE DOWNLOADED OFF THE ZEBRA SYSTEMS BBS.

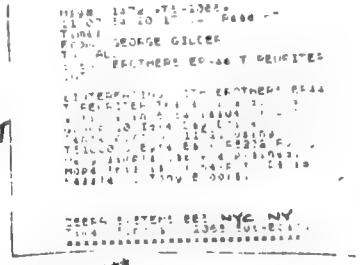
ANY RESPONSE WOULD BE GREATLY APPRECIATED.

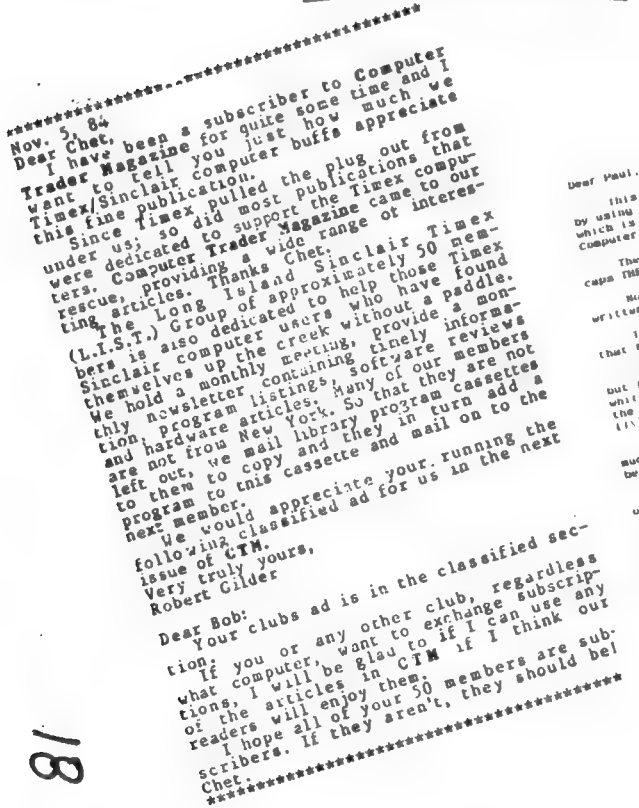
ALSO WHAT IS "LIST"? A MAGAZINE? IS IT T/S COMPUTER ORIENTED? COULD YOU PLEASE SEND INFORMATION ON THAT ALSO?

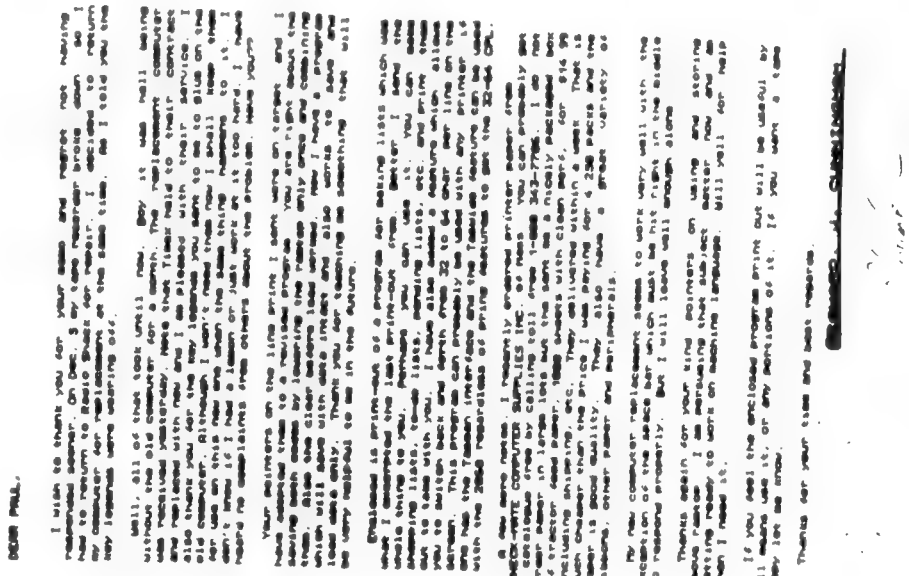
THANK YOU!

STAMFORD CT 06902









CATALOGS RECEIVED

VENDOR	PRODUCT
Budget Robotics & Computing Box 18616 Tucson, Az 85731	Bruce Taylor has the Computer Continuum Line, and will soon (mid '85) market a Complete robot system, as described in his forthcoming TAB book; "Build a Micro-computer Controlled Robot"
Sum-Ware 810 Mammot Road Alden, N.Y. 14004 716-547-2273 (after 6PM)	Stan Light's Ad is printed in this issue
Pleasantrees Programming	Paul Bingham will have a 2068 price list out soon
Toronto Software World PO Box 84 Agincourt, Ontario Canada MIS3B4	A limited number of Spectrum software titles, at "US" (not UK) type prices. Also has Software for's Forty Racer for hi res arcade action on ZX81
WMJ Data System 4 Butterfly Drive Hauppange, N.Y. 11788	Now stocks Quicksilva and Software titles Has Romswitch for $54.95. Will soon publish new newletters "Quarters"
Scott Foresman & Co. 1900 East Lake Avenue Glenview, Ill 60025 (312) 729-3000	New book by Jim Stephens Powerful projects with your T/S 256 pages $12.95 ISBN 0-673-18038-7

K Soft Co. 845 Weliner Road Naperville, Il 60540 (312) 961-1250	Tax return 1984 - $18.00 + 1.50 1040 & A,B,C,D & E TS1000 or 2068 - Takes Visa/MC
John F. Brosky 5980 Lannoo Detroit, Mi. 48236	Has 16K RAM packs for $18.00 plus postage

NEXT MONTH:
A Listing of the ZX/TS publications still in business both commercial & user groups.

MEMBERS

Do you subscribe to other TS User Group publications? We're compiling a list of these for the next issue. If you know of one with a good newsletter, please give us some feedback, or send a few sample pages of a copy of our newsletter to them. Do remind them though, that they must receive written permission from us to reprint any of the articles. (So far, most of the newsletters we've seen are doing quite well with their own material. In fact, we have only received one reprint request (From Syncware News), to date). Remember, copies of other groups newsletters are in the "library".

Ralph Smith called last weekto tell me that the Spectrum ROM that he ordered from LIST(Long Island Sinclair Timex) Users Group ($28) arrived in 5 working days. He was very "happy with their efficiency". A "Shortwave Listener' Rob Harrington has been in contact with me regarding joining the group. He lives in Lakewood and just got a Memotech RS-232 I/F for his 1000 and now waits eagerly for his modem. By the way, he tells me that the I/F is still available from Memotech at $79.95 with a cable for $19.95 plus $4.95 shipping. Write to: Memotech Direct Sales Division, 99 Cabot St, Needham, MA 02194. (617) 449-6614.

This little gem is from the Mile High TSUG newsletter (They're in Aurora, Co.). The confusion between LIST G & LIST A is till prevalent, but at least, LISTA is not giving LISTG any black eyes.

MICRODRIVES UPDATE
BY N. PASHTOON

The Dec./Jan. issue of LIST carried an article on the microdrives , and the interface called the Twistor , which is required between the TS2068 and the Sinclair Interface 1. In the haste of meeting the LIST publication deadline , I had left out some of the RST XX for the shadow ROM in the Interface 1 . These RST's follow :

RST 28 : The 16K Home ROM error check is done . ERRNR should be loaded with the required error code before the RST.
RST 3Ø : If the Interface 1 variables are not established , a RST 3Ø will create them .
RST 38 : Interrupts on .

An update is also in order for the storage capacity of the cartridges . With two drives connected , I formatted ten blank carts. on the drive for which results were reported in the last issue. The average storage capacity came to 88.8 kB ±1 kB. Formatting the same cartridges on the other drive resulted in an average storage capacity of 98.7 kB , with the highest storage at 102 kB and the lowest at 95 kB. Both drives are new , why there is a difference I have no idea.

****

In the paragraphs to follow, I will detail the redesign of the Twistor , which became necessary in light of tests with other TS2068's. Our editor thought that it may be of interest to hardware hackers to present my experimental observations , hypotheses , possible solutions in chronological order . If details like these bore you , then jump to the final solution at the end of the article. Otherwise follow the reasoning , and if you think you are reaching a different conclusion , then provide us with feedback , so we can sit and have a nice technical powwow . I am hoping to provide you with actual timing wave forms in the next issue of LIST (no promises).

Last month's report on microdrives for the TS2068 equipped with EMU-1 was based on extensive testing on two computers that I have . On these two machines the Twistor worked perfectly and consistently everytime . I typed and xeroxed last month's article , and had a demo. of the drives for the hardware hackers of our group on Dec. 16,1984. The LIST mailing started on the 17th. On the 18th I got a new TS2068 and discovered that most of the time it crashed , and some times half finished microdrive error messages will appear on the screen . I assumed that that the rigid board design of the Twistor was responsible , causing poor connections at the edge connectors . After alot of juggling with the board , I finally connected the Twistor by using a 12" long cable and the Oliger's expansion board . The computer started working , with some infrequent errors . The total length of the wires etc. connecting the computer and the Interface 1 came to 24". I assumed that possibly the shadow ROM is jumping the gun and grabbing the bus too early. The capacitance of the cable is causing delays and thus solving the contention problem.In order to simulate the effect of the cable capacitance with dicrete caps., I estimated that the cable cap. can't be more than 50-60 pF .

Later measurements showed the capacitance between the wires to be between 25-30 pF. I didnot want to load the whole bus therefore I connected 91 pF caps to the control lines (only) leading to Interface 1 . This didnot have much effect . Now reasoning that since RSTØ8 is responsible for the turn on of the shadow ROM , i.e. when 0008 appear on the address bus that ROM is turned on , then a delay of A3 will improve things. When the 91 pF cap. was connected to A3 the computer started working consistently .

In order to isolate the problem , still thinking that the shadow ROM was jumping the gun , I put a delay in the A3 line. The delay consisted of one buffer from the CD4050 IC. The CD4050 gives a delay of 60 nS typically , up to 120 nS max. , for 5V supply . This made matters worse . Even the good computers started to work erratically . The conclusion is that the problem is inside the computer.

At the January 6 meeting I asked members to bring in their computers for testing . 7 out of 10 computers worked without the cap. on A3 . Two worked with the cap. in . One computer refused to work. I have been communicating the mods. to another TSUG , but they had absolutely no success . The same group provided me with info. on a group out West , whose micro drives would work some times.In another words,there definitely existed a problem to be looked into.

At the time the weather started to become cold. I noticed that on my bad computer , when it was cold , it would start misbehaving for the initial few minutes, and would work properly after warm up . The data sheets on memories showed that they respond faster at lower temperatures. In the mean time I did experiment with a dozen circuits like introducing one T state WAIT when the shadow ROM would turn on , to decoding circuitry using $\overline{\text{ROMCS}}$ from Int.1 and the processor's $\overline{\text{RD}}$, A13, A14, A15, $\overline{\text{MREQ}}$, with the decoder feeding the the $\overline{\text{BE}}$ input of the computer . Some of the circuits even successfully switched the banks . The problem still persisted ;namely, the two good computers will work , and the bad one will either be crashing or giving the wrong messages.

I should mention that the $\overline{\text{ROMCS}}$ from Int. 1 is an output . It goes tri-state when the Spectrum ROM is active , and becomes active high when the shadow ROM is active. This is an important feedback mechanism in the Spectrum where it is connected to the $\overline{\text{CE}}$ of the Spectrum ROM.

A cardinal rule that I follow , when doing hardware work on the TS2068 , is that DO NOT IMPLEMENT ANY INSIDE MODS. on the computer . All mods. must be on the outside. The idea is, of course, to obtain a universal solution to a problem .

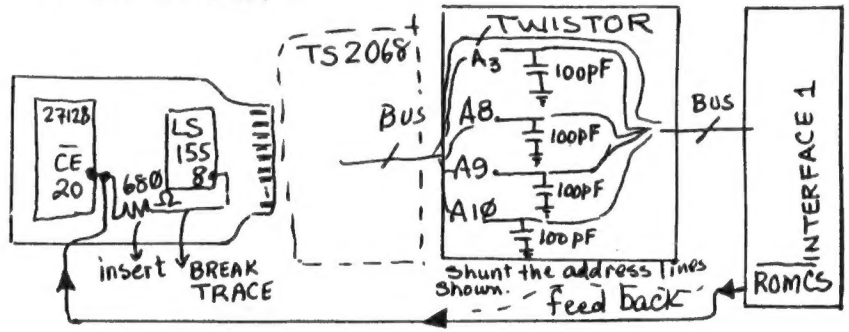
By watching the display of error messages on the bad computer for hours (literally) I found out that in a blink of an eye (probably 1/60-th of a second) the correct error message did appear on the screen , but then gibberish will be displayed . My conclusion was that the shadow ROM was

turning on properly , but that the turn off was a problem . A study of the ROM disassembly , and the literature at hand revealed that when address Ø7ØØH was in the PC, and hence on the address bus, the shadow ROM will turn off . Since Ø7ØØH had the A8,A9,A10 bits set , I argued that a delay of these three bits would help . As such I put 91 pF caps on these three lines . Lo and behold! the problem got solved . I must mention that thus far in my experimentation not alone the printer , but any other peripheral on the Spectrum bus (behind the Int.1) will cause all the computers to be in a crash state . I attributed the problem to the excessive loading of the bus . But with caps on A3, A8, A9, and A10 , now for the first time the printer started working. That night the temperature was cold (in the teens) outside . I took my bad computer , Int.1 , the emulator and put it outside for half an hour , when I turned it on it worked the first time around. I left the system on for 8 hours and it did not malfunction even once. The solution was communicated to the other TSUG the feedback was that it didnot work . It was not making sense ! I went to work to collect some timing data. While doing that , I zapped my EMU-1. Very probably static got! since every few minutes I was installing the EMU-1 in the good computer and then in the bad one . I didnot know at the time , but it was a lucky coincidence . Being desperate to continue experimentation , I successfully was able to use the Spectrum ROM as an emulator , and make it work with the drives(more on this , may be in a future issue of LIST).

I ordered another EMU-1 and tested it with my computers. With all the suggested mods on the Twistor, all of them were continously in a crash state . In other words I was now in the same boat as the other TSUG. Consulting with the manufacturer of EMU-1 there was no code changes in the contents of the EPROM . I programmed EPROMs , again the same result. So vive la difference? A comparison of the zapped EPROM and the EPROM on the new EMU-1 revealed that originally EMU-1's were programmed on 300 nS chips , but the new batches were programmed on 250 nS EPROMs . In other words, a time of 50 nS was making all the difference . So I set out to simulate a low speed EPROM . The following circuit was tested on the EMU-1 board by breaking the traces to the $\overline{CE}$ and $\overline{OE}$, and inserting the CD4050 buffers to create an artificial delay .

The result of the experiment was that all three computers got out of the continous crash state , and would work from time to time . Note that the simulation is not perfect , since we will need to delay all the 16 address lines also. There is not that much space on the EMU-1 board . All this information was relayed to the other TSUG . While I am writing this I got a call from them , that for the first time there computers are working with the Int-1 when they replaced the 250 nS chip with a 300 nS chip in the EMU-1.

Now I had to address the problem of the 250 nS EMU-1's. Note that all the experiments so far were the so called open loop type . In other words when such a nice feedback signal is available from Int.1 like $\overline{ROMCS}$, signalling the computer when it is active , it should be used. The fastest way to provide such feedback to the DOCK bank in TS2068 is a hardwire connection between the EMU-1 and the Int.1. I grant you that the same is achievable by using the $\overline{BE}$ input of the computer , as mentioned earlier , and one would be tempted to call it an elegant solution. But the penalty is the use of one or two very fast chips . Any way, I believe the solution to be universal and should work on all TS2068 computers . All my three computers work perfectly and with the printer load attached . Here are the mods. :



CONCLUSION: A):The reason some of the TS2068 computers will not work with the microdrives , even with a 300 nS EPROM in the EMU-1 is the bus contention between the Int.1, and the EPROM on the EMU-1.
B) A 300 nS EPROM on the EMU-1 if used in conjunction with the caps. on A3,A8,A9,A10 does solve the problem even in an open loop configuration.
C) Closing the feedback loop , as per diagram above, and the caps. does solve the problem even with a faster EPROM in the EMU-1 , and as such is a universal solution.

AFTERTHOUGHTS :The problem of ringing on the address lines can't be ruled out . More measurements are required.
An experiment with a 450 nS EPROM is called for . This will reduce the cost of EMU-1's . I will report on such an experiment in the future.
Some hardware hackers will take anissue with the dirty and fast solution of putting caps. on the suggested address lines. The value of 100 pF is also excessive , and will tell me that it is a no-no in microprocessors system design. My response is show me one microcomputer that do not use it . To witness, open up your TS2040 printer .What are all those caps doing on the address and data lines ? I very well recall desoldering them , because it will not work with another peripheral on ZX-81. The removal of the caps. did make the system work. For that matter , if you open your TS2068 , you will notice caps near the edge connector. NAP Jan.19,1985

A CROSS-CORRELATION OF THE SPECTRUM ROM VERSUS TS2068

Part 2

Beside Logan's book mentioned in Part 1, one needs to have a good disassembler . There are various disassemblers available for the TS2068. In an earlier issue of LIST Paul had reviewed the one written by Dick Scoville of Triangle Users Group. Scoville's diassembler is written in Basic. It is a simple disassembler, but does its job well . For the price ($5.00) one can't beat it . Zebra is also marketting the Crystal Computing disassebmler. This product (the Spectrum version) is officially approved by Sinclair Research, and matches the Zeus Assembler . It is a good , sophisticated disassembler with many functions from block moves to including a breakpoint in your code , and register displays. The last disassembler I like to mention is my favorite since the ZX81 days , namely the HOT Z , written by Ray Kingsley. The HOT Z is both an assembler and disassembler.To give you a full description of its capabilities will require a full long article . Suffice it to say , that it can do almost any thing that other assemblers and disassemblers can do and more. The product was developed specifically for the TS2068. There is both cassette ($24.95) and cartridge ($60.00) versions available. The nice thing about the cartridge version is that it uses only a few hundred bytes of your RAM. The program itself is in the DOCK bank , shadowing the RAM. The most important feature of HOT Z is that it has a very large NAMES file , which will label all important routines in the TS 2068 ROMs.
